

# Biomolecular Modeling with Molecular Dynamics Introduction

Marcus Elstner and Tomáš Kubař

2018, April 20

# Biomolecular structure

Structural elements of life

Biomolecules – proteins, nucleic acids, lipids, carbohydrates ...

# Biomolecular structure

Biomolecules → biomolecular complexes → aggregates → ... → organelles → a cell

## Biophysical processes

- Bioenergetics – reception, transformation and utilization of energy
- Catalysis – synthesis of substances, metabolism
- Transport – exchange of small molecules, ions up to proteins with the surroundings
- Sensing – detection / recognition / binding in presence of a stimulus

Theoretical / computational biophysics

- Focus: understanding on the atomic scale
- The **structure** and **dynamics** determine the **properties** and **function** of biological molecules
- Prediction of experimentally relevant data
- Molecular design of materials with desired properties
- The way to the goal – in general:  
solution of quantum mechanical many-body problem
- QM MB approach would be too inefficient  
→ apply more approximative methods

# Methods

# Methods

- Quantum chemistry (QM)
  - bonds created/broken
  - computationally costly
  - DFT or ab initio, up to 100 atoms
  - semi-empirical, up to 1000 atoms
- Molecular mechanics (MM)
  - efficient for up to 100,000 atoms
  - generally – structural properties
- Hybrid QM/MM
  - chemical reactions
  - etc.

- 1687 – equations of motion (Newton)
- similar – harmonic spring (Hooke)
- ...
- 1946 – molecular mechanics
- 1950s – useful computers
- 1959 – molecular dynamics of a fluid (Alder & Wainwright)
- 1975 – molecular dynamics of a protein  
(Levitt & Warshel, Gelint & Karplus)
- 1976 – QM/MM proposed (Levitt & Warshel)
- 1990 – significant QM/MM work (Karplus)

1st simulation of protein dynamics

- BPTI, 58 AAs, in vacuo, 9.2 ps
- McCammon, Gelin & Karplus, Nature 1977
- starting point – crystal structure

# Timeline

simulation of protein in aqueous solution

- BPTI + water, 210 ps
- Levitt & Sharon, PNAS 1988

today's standard

- 100,000 atoms, 100 ns

# Contact with experimental reality

- X-ray and neutron diffraction
- electron cryomicroscopy (cryo-EM)
- STM/AFM imaging
- electronic / optical spectra
- vibrational / IR spectra
- electronic and nuclear magnetic resonance
- thermodynamic measurements – DSC, ITC

# Applications

## Structure and dynamics of complex biomolecular systems

- protein folding
- protein–ligand interaction
- proteins as nanomachines

# Applications

## Transport

- electrons
- protons – across membrane
- water, ions, small molecules, ...

# Applications

## Enzymes

- catalyzed chemical reactions
- energy conversion (light, chem., mech., gradients)
- bioenergetics

# Challenges

- system size limited to ca. 100,000 atoms
- time scales limited to few microseconds
- accuracy of description
  - bonded interaction (vibration, rotation)
  - non-bonded interaction (charge-transfer, polarizability)
- excited electronic states
- quantum character of movement of nuclei

Some can be tackled with

- further development of available methods
- combination of various methods
- optimization of algorithms
  - parallelization,  $\mathcal{O}(N)$  – linear scaling

## The Nobel Prize in Chemistry 1998

Walter Kohn

Prize share: 1/2

John A. Pople

Prize share: 1/2

The Nobel Prize in Chemistry 1998 was divided equally between Walter Kohn *"for his development of the density-functional theory"* and John A. Pople *"for his development of computational methods in quantum chemistry"*.

## The Nobel Prize in Chemistry 2013

**Arieh Warshel**

The Nobel Prize in Chemistry 2013 was awarded jointly to Martin Karplus, Michael Levitt and Arieh Warshel *"for the development of multiscale models for complex chemical systems"*.

# Biomolecular simulation

Elementary body – **atom**

Usually – one molecule/complex of interest (e.g. protein, NA)

## Simulation vs. reality

One molecule instead of many

Tiny volume of  $\approx 10^{-21}$  L

instead of  $\approx 10^{-5}$  L

Dynamics – short time scale

of max.  $\approx 10^{-5}$  s

# Biomolecular simulation

Each atom –  $x, y, z$  coordinates

“A protein is a set of coordinates.” (Gromacs, A. P. Heiner)

```

Why should we want to simulate molecular systems?

Experiment – the molecule has its genuine properties

Simulation – we need a model to describe the interactions of atoms  
– the quality of the model is decisive

Advantage of simulation – structure on atomic level defined

Structure → function

Combination of experiment and simulation – added value
